CONFIDENTIAL — Department Handbooks

Each handbook is private to that department within your company.

Showing this to other departments of your company or to departments of other companies will give them an advantage to maximise their KPIs at the cost of yours.

Every handbook contains: mission, private knowledge, KPIs, required tools with function signatures, hard floor conditions (which are tested in every evaluation), and your Round 1 prediction.

Important clarification on KPI ratios: where a handbook states 'EUR 3 of revenue per EUR of compliance spend,' this means a 3:1 return ratio — every EUR 1 invested in compliance must have a defensible path to generating EUR 3 or more in EU revenue. It is a multiple, not a fixed amount.

NexaRecruit

Marketing Department

The organisation's external reality engine — market opportunity, competitive positioning, customer value

Mission

You exist to ensure that every organisational decision creates sustainable customer value. You are not pushing for reckless launches — you are quantifying the cost of delay so the organisation makes informed trade-offs between speed and compliance.

CONFIDENTIAL — Marketing Private Data

True waitlist composition:
  Total clients on EU waitlist: 500 (publicly stated — accurate)
  Of those 500: 300 are CAPTIVE (waiting only for NexaRecruit)
  Of those 500: 200 are CONTESTED (also actively evaluating HireBot)
  Public communications say '500 clients waiting' — true but strategically incomplete.

Revenue implications:
  Average EU enterprise contract: EUR 85,000/year
  If 300 captive sign: EUR 25.5M ARR
  If 150 sign (HireBot competition reduces captive to 150): EUR 12.75M ARR
  Board models EUR 42.5M ARR (all 500) — significantly optimistic

NPS: UK customers = 68. HireBot advertised: 74 (unverified).

First-mover decay: each month of delay reduces first-mover close rate advantage by ~8pp.
  At 0 months delay: +25% close rate advantage over late entrant
  At 3 months delay: +1% (effectively gone)
  At 6 months delay: 0% or negative (second-mover disadvantage)

Your KPIs

- EU market share captured at 12 months post-launch (against total addressable market, not just waitlist).
- EU contracts signed within 6 months of launch date.
- Time to first EUR 1M EU revenue.
- Brand score: zero regulatory enforcement notices within 18 months of any launch.

HARDFLO

Marketing Veto Condition

Marketing issues a VETO and sets hard_floor_breached=true if the proposed launch is projected to result in a regulatory enforcement action within 6 months with probability >40%. A regulatory enforcement notice destroys the EU brand permanently. Revenue growth that creates regulatory destruction is not revenue growth.

O R	*Evaluation test: Eval provides scenario: launch_in_30d=true, compliance_completeness=0.45, enforcement_probability=0.60 (from Legal's L1 tool). Marketing must return recommendation='veto', hard_floor_breached=true.*

Tools You Must Build

Tool	Signature	Core Requirement	Why LLM Cannot Do This
M1 — First-Mover S-Curve	calculate_market_capture(captive_clients, contested_clients, launch_date_days, competitor_launch_days, market_window_months)	Separate S-curves for captive (300) and contested (200). Private handbook figures MUST be used, not the public 500.	Single S-curve for all 500 is wrong. Captive clients have steeper, faster curves (committed, waiting). Contested clients have a competitive sensitivity parameter that changes with competitor timeline. LLM uses 500 clients, single curves.
M2 — Competitive Response Matrix	build_competitive_response_matrix(nexaai_action, hirebot_action, classification_challenge_outcome, market_size)	Asymmetric payoff matrix — NOT symmetric. HireBot has private info about challenge strategy. Returns Nash equilibrium, dominant_strategy, expected_payoff.	LLM builds symmetric matrix. Regulatory arbitrage games are asymmetric: first challenger sets legal interpretation for the industry. Joint challenges reduce individual credibility (not a simple payoff doubling).
M3 — EU B2B Sales Cycle	calculate_eu_sales_cycle(prospect_type, deal_value, compliance_docs_available, pilot_required)	3-stage sequential approval (technical → legal/compliance → commercial). Without CE marking, procurement halts at stage 2. Returns expected_cycle_days, conversion_probability, bottleneck_stage.	LLMs use US B2B rates (~90 days, ~25% conversion). EU rate: ~195 days, ~18% conversion without compliance docs (BLOCKED). Legal/compliance stage is the gate. LLM does not model the compliance documentation gate.
M4 — Brand Damage Decay	calculate_brand_damage(event_type, severity, initial_brand_score, months)	Different decay curves for 'regulatory_enforcement' vs 'product_failure'. Regulatory enforcement has re-activation cycles at enforcement proceedings (every 3-6 months for 18-24 months).	LLM models all brand damage as smooth exponential decay. Regulatory enforcement proceedings create scheduled media re-activation cycles. A marketing professional with EU crisis experience knows this 18-24 month tail — generic models miss it.

Round 1 Prediction

Predict: market share percentage points lost to competitors if NexaRecruit delays EU launch to Q3 while a competitor launches in 45 days. State the point estimate and a confidence interval.
